May 25, 2015, IMPA, Rio de Janeiro

CNRS. École Polvtechnique

Alena Pirutka

k a field, X/k of finite type, equidimensional,  $d = \dim(X)$ .

Alena Pirutka Diagonal Arithmetics. An introduction : Chow groups.

k a field, X/k of finite type, equidimensional,  $d = \dim(X)$ . (often consider X a projective variety, i.e. defined by homogeneous polynomials with coefficients in k).

Diagonal Arithmetics. An introduction : Chow groups.

k a field, X/k of finite type, equidimensional,  $d = \dim(X)$ . (often consider X a projective variety, i.e. defined by homogeneous polynomials with coefficients in k). Look at all  $V \subset X$  irreducibles of dimension d - i. A *cycle* is a formal linear combination of such V's: the *group of cycles* of codimension *i* is

$$Z^i(X) = Z_{d-i}(X) = \oplus \mathbb{Z} V$$

CNRS. École Polvtechnique

Alena Pirutka

k a field, X/k of finite type, equidimensional,  $d = \dim(X)$ . (often consider X a projective variety, i.e. defined by homogeneous polynomials with coefficients in k). Look at all  $V \subset X$  irreducibles of dimension d - i. A *cycle* is a formal linear combination of such V's: the *group of cycles* of codimension *i* is

$$Z^i(X) = Z_{d-i}(X) = \oplus \mathbb{Z} V$$

CNRS. École Polvtechnique

Denote  $[V] := 1 \cdot V \in Z^{i}(X)$  the cycle corresponding to V, we call such cycle *prime*.

k a field, X/k of finite type, equidimensional,  $d = \dim(X)$ . (often consider X a projective variety, i.e. defined by homogeneous polynomials with coefficients in k).

Some properties :

Look at all  $V \subset X$  irreducibles of dimension d - i. A *cycle* is a formal linear combination of such V's: the *group of cycles* of codimension *i* is

$$Z^i(X) = Z_{d-i}(X) = \oplus \mathbb{Z} V$$

Denote  $[V] := 1 \cdot V \in Z^{i}(X)$  the cycle corresponding to V, we call such cycle *prime*.

CNRS. École Polvtechnique

Alena Pirutka

• (push-forward) for  $f : X \to Y$  proper define  $f_* : Z_i(X) \to Z_i(Y)$  by  $f_*([V]) = 0$  if  $\dim f(V) < i$  and  $f_*([V]) = a \cdot f(V)$  if  $\dim f(V) = i$ , where a is the degree of the field extension k(V)/k(f(V)).

- (push-forward) for  $f : X \to Y$  proper define  $f_* : Z_i(X) \to Z_i(Y)$  by  $f_*([V]) = 0$  if  $\dim f(V) < i$  and  $f_*([V]) = a \cdot f(V)$  if  $\dim f(V) = i$ , where a is the degree of the field extension k(V)/k(f(V)).
- ▶ (pull-back ) If  $f : X \to Y$  is flat of relative dimension n,  $f^* : Z_i(Y) \to Z_{i+n}(X), f^*([W]) = [f^{-1}(W)], W \subset Y.$

- (push-forward) for  $f : X \to Y$  proper define  $f_* : Z_i(X) \to Z_i(Y)$  by  $f_*([V]) = 0$  if  $\dim f(V) < i$  and  $f_*([V]) = a \cdot f(V)$  if  $\dim f(V) = i$ , where a is the degree of the field extension k(V)/k(f(V)).
- ▶ (pull-back) If  $f : X \to Y$  is flat of relative dimension n,  $f^* : Z_i(Y) \to Z_{i+n}(X), f^*([W]) = [f^{-1}(W)], W \subset Y.$
- (intersections) V ⊂ X and W ⊂ X intersect properly if all irreducible components of V ×<sub>X</sub> W have codimension codim<sub>X</sub>V+codim<sub>X</sub>W. One then defines V · W as the sum of these components (with some multiplicities!).

CNRS. École Polvtechnique

- (push-forward) for  $f : X \to Y$  proper define  $f_* : Z_i(X) \to Z_i(Y)$  by  $f_*([V]) = 0$  if  $\dim f(V) < i$  and  $f_*([V]) = a \cdot f(V)$  if  $\dim f(V) = i$ , where a is the degree of the field extension k(V)/k(f(V)).
- ▶ (pull-back) If  $f : X \to Y$  is flat of relative dimension n,  $f^* : Z_i(Y) \to Z_{i+n}(X), f^*([W]) = [f^{-1}(W)], W \subset Y.$
- (intersections) V ⊂ X and W ⊂ X intersect properly if all irreducible components of V ×<sub>X</sub> W have codimension codim<sub>X</sub>V+codim<sub>X</sub>W. One then defines V · W as the sum of these components (with some multiplicities!).
- For X/C smooth projective one has a cycle class map c<sup>i</sup>: Z<sup>i</sup>(X) → H<sup>2i</sup>(X, Z), giving Z<sup>i</sup>(X) ⊗ Q → Hdg<sup>i</sup>(X) where Hdg<sup>i</sup>(X) = H<sup>2i</sup>(X, Q) ∩ H<sup>i,i</sup>(X) (the Hodge classes). The Hodge conjecture predicts that this last map should be surjective.

#### Equivalence relations

 $Z^*(X) := \oplus Z^i(X)$  is is too huge!

Alena Pirutka

Equivalence relations

 $Z^*(X) := \oplus Z^i(X)$  is is too huge! Question: what cycles should one consider as equivalent?

Diagonal Arithmetics. An introduction : Chow groups.

#### Equivalence relations

 $Z^*(X) := \oplus Z^i(X)$  is is too huge!

Question: what cycles should one consider as equivalent?

- $\sim$  an equivalence relation on algebraic cycles is adequate if
  - $ightarrow \sim$  is compatible with addition of cycles;
  - for any X/k smooth projective and α, β ∈ Z\*(X) one can find α' ~ α and β' ~ β such that α' and β' intersect properly (i.e. all components have *right* codimension)
  - if X, Y/k are smooth projective, pr<sub>X</sub> (resp. pr<sub>Y</sub>) X × Y → X (resp. Y) is the first (resp. second) projection and α ∈ Z\*(X), β = pr<sub>X</sub><sup>-1</sup>(α) and γ ∈ Z\*(X × Y) intersecting β properly, then α ~ 0 ⇒ pr<sub>Y\*</sub>(β · γ) ~ 0.

- (cycle class) for X smooth projective, we have  $CH^{i}(X) \rightarrow Hdg^{i}(X)$   $(k = \mathbb{C})$ .
- ► (localisation sequence) \(\tau: : Z \subset X\) closed, \(j: U \subset X\) the complement. Then we have an exact sequence

$$CH_i(Z) \xrightarrow{\tau_*} CH_i(X) \xrightarrow{j^*} CH_i(\bigcup) \xrightarrow{\tau_*} 0$$

Alena Pirutka

CNRS, École Polytechnique

## Correspondences

Let X, Y/k be smooth projective varieteies. Then

• Any map  $f: X \to Y$  gives  $f_*: CH_i(X) \to CH_i(Y)$ 

Alena Pirutka Diagonal Arithmetics. An introduction : Chow groups.

## Correspondences

Let X, Y/k be smooth projective varieteies. Then

- Any map  $f: X \to Y$  gives  $f_*: CH_i(X) \to CH_i(Y)$
- More : any α ∈ CH<sub>\*</sub>(X × Y) gives α<sub>\*</sub> : CH<sub>\*</sub>(X) → CH<sub>\*</sub>(Y): if γ ∈ CH<sub>\*</sub>(X), then α<sub>\*</sub>(γ) = pr<sub>Y\*</sub>(α · pr<sup>\*</sup><sub>X</sub>(γ)), i.e. α<sub>\*</sub> is the composition

$${\it CH}_*(X) o {\it CH}_*(X imes Y) \stackrel{\cdot lpha}{ o} {\it CH}_*(X imes Y) o {\it CH}_*(Y).$$

- On cohomology: any  $\alpha \in CH^i(X \times Y)$  gives  $\alpha_* : H^*(X, \mathbb{Q}) \to H^*(Y, \mathbb{Q}) : \alpha_*(\gamma) = pr_{Y*}(c^i(\alpha) \cup pr_X^*(\gamma)),$  $\gamma \in H^*(X, \mathbb{Q}).$
- An important example : consider Δ<sub>X</sub> ⊂ X × X the diagonal. Then [Δ<sub>X</sub>]<sub>\*</sub> is the identity map.
