

Concavity

Monday, October 26, 2020 5:24 PM

Concavity and Rates of change. (section 2.6)

Example

| | | | | | |
|---|----|----|-----|-----|-----|
| t | 0 | 10 | 20 | 30 | 40 |
| S | 40 | 72 | 128 | 230 | 411 |

Determine the concavity from a table.

← increasing function.

Rates of change
 $\frac{\Delta S}{\Delta t}$

$$\frac{72-40}{10-0} = 3.2$$

$$\frac{128-72}{20-10} = 5.6$$

$$\frac{230-128}{30-20} = 10.2$$

To find the concavity we compute the rates of change.

The rate of change is increasing, thus the function is concave up.

increasing and concave up

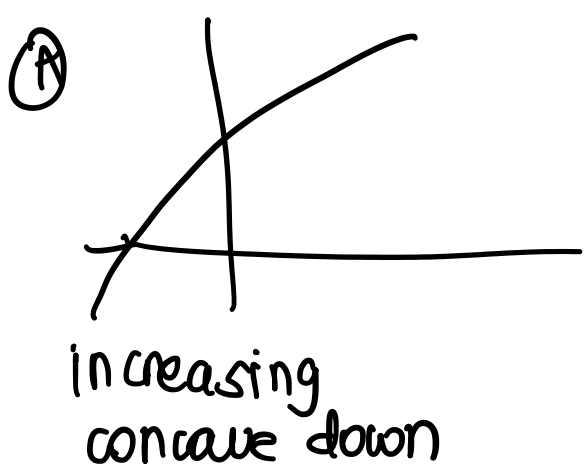

Example

A function can be decreasing and still concave up.

The average rate of change is negative but it's increasing so the function is concave up.

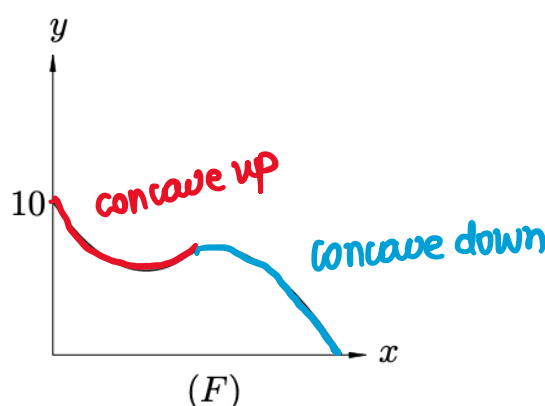

Summary

concave up

concave down.

1. [12 points] Use the graphs to answer the questions below.

a. [2 points] Which of the graphs above are concave down?

(A)

Note: A constant or linear function has no concavity.
