Change of Variables

Liming Pang

Another commonly used technique for integration is Change of Variable, also called Integration by Substitution.

Recall the Chain Rule for differentiation: If y = f(u) and u = g(x), then

$$\frac{dy}{dx} = \frac{dy}{du}\frac{du}{dx} = \frac{df}{du}(g(x))\frac{dg}{dx}(x)$$

The above implies that

$$dy = df(g(x)) = f'(g(x))g'(x) dx = f'(g(x)) dg(x) = f'(u) du$$

so we obtain the following theorem:

Theorem 1. (Change of Variables) If f(u) is continuous and u = g(x) is continuously differentiable, then

$$\int f(g(x))g'(x) dx = \int f(u) du$$

Remark 2. There are two possible situations to apply the method of change of variable. The first case is when we can write the given integral in the form of $\int f(g(x))g'(x) dx$ by a good choice of g(x), and then apply the formula. See Example 4,5,6

The second case is to use the theorem in the reversed way: let x be the intermediate variable by letting x = g(t), so $\int f(x) dx = \int f(g(t))g'(t) dt$. See Example 7

Remark 3. We can also write the change of variable in differential notation:

$$\int f(g(x)) dg(x) = \int f(u) du$$

where u = g(x)

Example 4. Compute $\int x^2 + 2x + 1 dx$

$$\int x^2 + 2x + 1 dx = \int (x+1)^2 dx$$
$$= \int (x+1)^2 d(x+1)$$
$$= \frac{1}{3}(x+1)^3$$

Example 5. Compute $\int x\sqrt{1+x^2} dx$

$$\int x\sqrt{1+x^2} \, dx = \int \frac{1}{2}\sqrt{1+x^2} \, d(1+x^2)$$
$$= \frac{1}{2} \int \sqrt{1+x^2} \, d(1+x^2)$$
$$= \frac{1}{2} \times \frac{2}{3} (1+x^2)^{\frac{3}{2}} + C$$
$$= \frac{1}{3} (1+x^2)^{\frac{3}{2}} + C$$

Example 6. Compute $\int 2xe^{-x^2} dx$

$$\int 2xe^{-x^2} dx = -\int e^{-x^2} d(-x^2)$$
$$= -e^{-x^2} + C$$

Example 7. Compute $\int \ln x \, dx$

Let $x = e^t$, so $t = \ln x$.

$$\int \ln x \, dx = \int \ln e^t \, de^t = \int t de^t$$
$$= t e^t - \int e^t \, dt$$
$$= t e^t - e^t + C$$
$$= x \ln x - x + C$$

There is also a corresponding formula for definite integrals:

Theorem 8. If f(u) is continuous and u = g(x) is continuously differentiable, then

$$\int_{a}^{b} f(g(x))g'(x) \, dx = \int_{g(a)}^{g(b)} f(u) \, du$$

Proof. Let F be an antiderivative of f, then

$$\int_{a}^{b} f(g(x))g'(x) \, dx = F(g(x)) \Big|_{a}^{b} = F(u) \Big|_{g(a)}^{g(b)} = \int_{g(a)}^{g(b)} f(u) \, du$$

Example 9. Evaluate $\int_1^e \frac{1+\ln x}{x} dx$ There are different alternatives to apply the rules:

Method I:

$$\int_{1}^{e} \frac{1 + \ln x}{x} dx = \int_{1}^{e} (1 + \ln x) d \ln x$$

$$= \int_{\ln 1}^{\ln e} (1 + u) du$$

$$= \int_{0}^{1} (1 + u) du$$

$$= u + \frac{1}{2} u^{2} \Big|_{0}^{1}$$

$$= \frac{3}{2}$$

Method II:

$$\int_{1}^{e} \frac{1 + \ln x}{x} dx = \int_{1}^{e} (1 + \ln x) d(1 + \ln x)$$

$$= \int_{1 + \ln 1}^{1 + \ln e} u du$$

$$= \int_{1}^{2} u du$$

$$= \frac{1}{2} u^{2} \Big|_{1}^{2}$$

$$= \frac{3}{2}$$

Method III: Let $x = e^t$

$$\int_{1}^{e} \frac{1 + \ln x}{x} dx = \int_{0}^{1} \frac{1 + \ln e^{t}}{e^{t}} de^{t}$$

$$= \int_{0}^{1} \frac{1 + t}{e^{t}} (e^{t})' dt$$

$$= \int_{0}^{1} \frac{1 + t}{e^{t}} e^{t} dt$$

$$= \int_{0}^{1} 1 + t dt$$

$$= \frac{3}{2}$$

Example 10. Evaluate $\int_0^1 \sqrt{1+x} \, dx$

$$\int_0^1 \sqrt{1+x} \, dx = \int_0^1 \sqrt{1+x} \, d(1+x)$$
$$= \int_1^2 \sqrt{u} \, du$$
$$= \frac{4}{3} \sqrt{2} - \frac{2}{3}$$

Example 11. Compute $\int_0^1 x^3 \sqrt{1+x^2} dx$

Method I:

$$\int_0^1 x^3 \sqrt{1+x^2} \, dx = \frac{1}{2} \int_0^1 x^2 \sqrt{1+x^2} \, d(1+x^2)$$

$$= \frac{1}{2} \int_0^1 ((1+x^2) - 1) \sqrt{1+x^2} \, d(1+x^2)$$

$$= \frac{1}{2} \int_{1+0^2}^{1+1^2} (u-1) u^{\frac{1}{2}} \, du$$

$$= \frac{1}{2} \int_1^2 u^{\frac{3}{2}} - u^{\frac{1}{2}} \, du$$

$$= \frac{1}{2} (\frac{2}{5} u^{\frac{5}{2}} - \frac{2}{3} u^{\frac{3}{2}}) \Big|_1^2 = \frac{2}{15} + \frac{2}{15} \sqrt{2}$$

There is another way of writing the above computation, though the reason behind are the same:

Let
$$u = 1 + x^2$$
, then $du = d(1 + x^2) = (1 + x^2)'du = 2xdx$

$$\int_{0}^{1} x^{3} \sqrt{1 + x^{2}} \, dx = \int_{1+0^{2}}^{1+1^{2}} x^{3} \sqrt{u} \frac{1}{2x} \, du$$

$$= \int_{1}^{2} \frac{x^{2}}{2} \sqrt{u} \, du$$

$$= \int_{1}^{2} \frac{u - 1}{2} \sqrt{u} \, du$$

$$= \frac{1}{2} \int_{1}^{2} u^{\frac{3}{2}} - u^{\frac{1}{2}} \, du$$

$$= \frac{1}{2} \left(\frac{2}{5} u^{\frac{5}{2}} - \frac{2}{3} u^{\frac{3}{2}} \right) \Big|_{1}^{2}$$

$$= \frac{2}{15} + \frac{2}{15} \sqrt{2}$$

Method II: Let
$$x = \sqrt{t^2 - 1} = (t^2 - 1)^{\frac{1}{2}}$$

$$\int_{0}^{1} x^{3} \sqrt{1+x^{2}} \, dx = \int_{1}^{\sqrt{2}} ((t^{2}-1)^{\frac{1}{2}})^{3} (1+((t^{2}-1)^{\frac{1}{2}})^{2})^{\frac{1}{2}} \, d(t^{2}-1)^{\frac{1}{2}}$$

$$= \int_{1}^{\sqrt{2}} (t^{2}-1)^{\frac{3}{2}} (1+t^{2}-1)((t^{2}-1)^{\frac{1}{2}})' \, dt$$

$$= \int_{1}^{\sqrt{2}} (t^{2}-1)^{\frac{3}{2}} t (\frac{1}{2}(t^{2}-1)^{-\frac{1}{2}} 2t) \, dt$$

$$= \int_{1}^{\sqrt{2}} t^{2} (t^{2}-1) \, dt$$

$$= \int_{1}^{\sqrt{2}} t^{4} - t^{2} \, dt$$

$$= \frac{t^{5}}{5} - \frac{t^{3}}{3} \Big|_{1}^{\sqrt{2}}$$

$$= \frac{2}{15} + \frac{2}{15} \sqrt{2}$$
