

Theory of Probability

Sep 16, 2020

Old interpretation of probability:
"long term frequency of events"

If E is an event, then

$P(E)$ = probability that E occurs

$$= \lim_{n \rightarrow \infty} \frac{n(E)}{n}$$

number of times E occurs in n trials.

Axioms of Probability

$P(E)$ = probability of event E

Axiom 1

$$0 \leq P(E) \leq 1$$

Axiom 2

$$P(S) = 1$$

↑ sample space.

Axiom For any sequence of mutually exclusive events $E_1, E_2, \dots, E_\infty$ (i.e. $E_i \cap E_j = \emptyset$ when $i \neq j$),

we have that
$$P\left(\bigcup_{i=1}^{\infty} E_i\right) = \sum_{i=1}^{\infty} P(E_i).$$

Some simple Propositions

Prop 1

$$P(E^c) = 1 - P(E)$$

Pf: $S = E \cup E^c$, and $E \cap E^c = \emptyset$

$$\Rightarrow P(S) = 1 = P(E \cup E^c) = P(E) + P(E^c)$$

(1)

Prop 2 If $E \subset F$, (Each outcome in E is also an outcome in F), then $P(E) \leq P(F)$.

Proof Since $E \subset F$, we can write

$$F = E \cup (E^c \cap F)$$

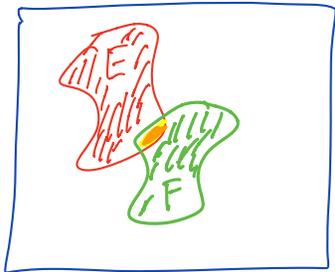

\uparrow \uparrow
mutually exclusive since E & E^c are mutually exclusive.

$$\Rightarrow P(F) = P(E) + P(E^c \cap F)$$

$$\Rightarrow P(F) \geq P(E) \text{ since } P(E^c \cap F) \geq 0.$$

Prop 3 - $P(E \cup F) = P(E) + P(F) - P(E \cap F)$

(also known as the principle of inclusion-exclusion)

$$P(E \cup F) = \text{E} + \text{F} - \text{E} \cap \text{F}$$

Prop 4 General inclusion-exclusion

$$P(E_1 \cup E_2 \cup E_3 \dots E_n)$$

$$= \sum_{i=1}^n P(E_i) - \sum_{i < j} P(E_i \cap E_j) + \sum_{i < j < k} P(E_i \cap E_j \cap E_k)$$

$$= \sum_{r=1}^n (-1)^{r+1} \sum_{i_1 < i_2 < i_3 \dots < i_r} P(E_{i_1} \cap E_{i_2} \dots E_{i_r}).$$

r events

When $n = 3$
